

Summary so far...

- Define Knowledge Base with facts and rules
- Prolog has a specific way of answering queries:
 - Search knowledge base from top to bottom
 - Processes clauses from left to right
 - Backtracking to recover from bad choices

The other half of the heart of Prolog

Recursive Definitions

- Prolog predicates can be defined recursively
- A predicate is recursively defined if one or more rules in its definition refers to itself

Example: Recursion

- Consider our family facts and rules...
- How would we define a predicate that tells us if one person is a *descendent* of another?

Example: Recursion

- Consider our family facts and rules...
- How would we define a predicate that tells us if one person is a *descendent* of another?

```
descendent (X, Y) :- child(X, Y) .
```

```
descendent (X, Y) :- child(X, Z), child(Z, Y) .
```

Example: Recursion

- Consider our family facts and rules...
- How would we define a predicate that tells us if one person is a *descendent* of another?

```
descendent (X, Y) :- child (X, Y) .
```

```
descendent (X, Y) :-
```

```
    child (X, Z) , descendent (Z, Y) .
```
